What is the web development and what are types of it?

Web development is the act of building.creating and maintaining

websites.the field cncompasses a broad range of tasks including everything

from coding,to technical design,to the performance of a website or

: application running on the internet.web development consists of

Front-end web development

Front-end web development is responsible for the look and feel of a website this means how colors,type,and images appear increasingly ,it keep up with cutting-edge trends in web design and development.

Back-end web development

Back-end web development is responsible for building and maintaining the code that runs a website.

Full stack web development

What is the difference between web developers and web designers?

Web designers keep themsolves busy with everything that has to do with the

 aesthetics of a website,web designers create a websites look and fell web

 developers create the code to make it work.Besides that usability and user

    experence while designing are equally as important.if notimportant ,web . designers donot only design ,its create trends,

IS the best for web developer to be full stackdevelopment or just one type of development

Full stack is the best because it command nigher salary package than

A full stack web developer has, frontend or back-end developers

Become the most songht after job profile for the past tew years,

 every organization locking for a seamless experience and this is

 easily advanced when there is just one person to do client-side and

 server-side coding,
